
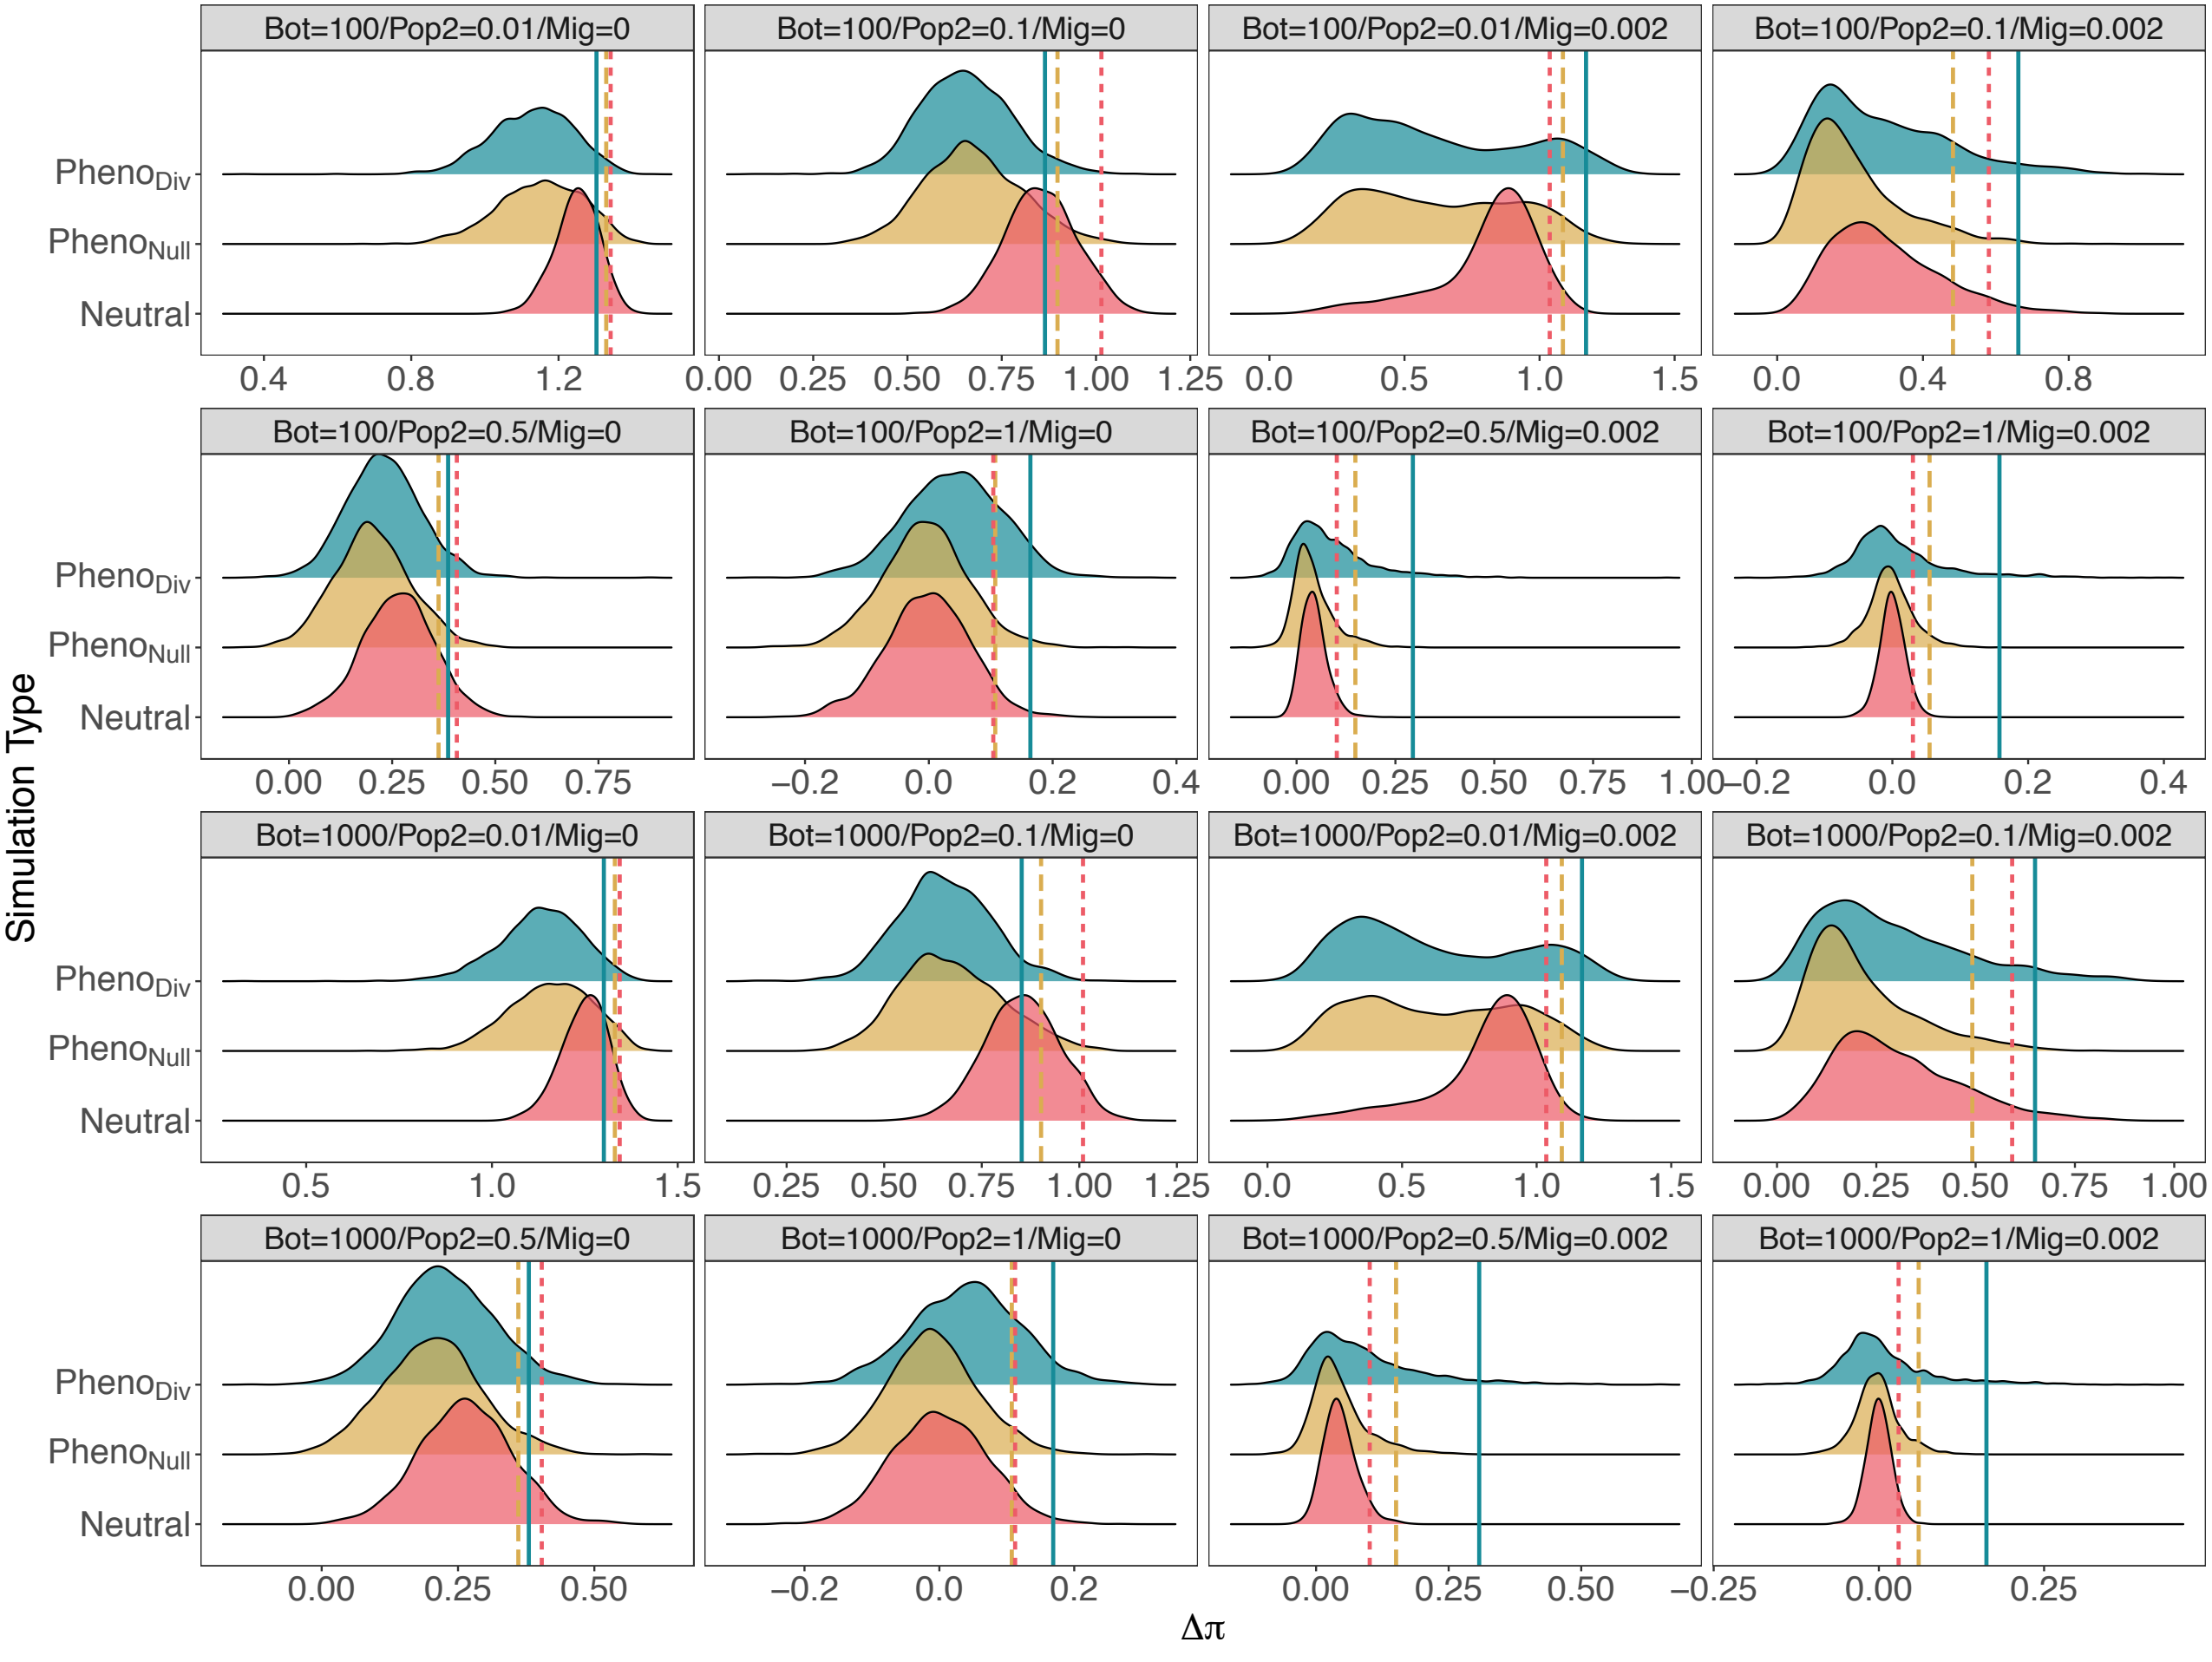

Figure S20: Distributions of Δπ under each of the 16 unique demographic treatments under three selection regimes: $Pheno_{Div}$ (divergent selection), $Pheno_{Null}$ (stabilising selection) and Neutral, after 3000 generations. Upper 5% quantiles are highlighted for each distribution, with linetype corresponding to selection: Solid = Divergent, Dashed = Stabilising, Dotted = Neutral. Each distribution represents data pooled from 20 iterations of 100 gene windows (N = 2000).
