

Supplemental Table of Mutations

Nicholas A. Sherer, Thomas E. Kuhlman

May 29, 2020

This file contains the mutations found by BreSeq for all samples. In order to make the tables fit better, we have abbreviated the sample names. L1 = Low 1, L2 = Low 2, LM 1 = LoMid 1, and so on. t1 are samples from day 24, and t2 are sample from day 41. Anc1, Anc2, and Anc3 are sequenced samples of the ancestral strain NS001 Δ cat, and AncAgg is a Breseq analysis of these three samples aggregated together to improve coverage.

The first table of SNP mutations has eight columns: the chromosome position of the mutation in the reference sequence of NS001 Δ cat, the reference nucleotide, the mutation nucleotide, the local sequence for five base pairs in both direction from the mutation (which is surround by curly brackets), the name of the gene if the mutation is inside a gene, the reference amino acid if the mutation is inside a gene, the new amino acid post-mutation, and the samples the mutation was found in.

The second table of deletion mutations has five columns: the chromosome position of the deletion in the reference sequence, the number of basepairs deleted, the local sequence for five base pairs in both directions from the first base pair with the deleted basepairs struck through, the name of the gene if the mutation is inside a gene or the names of the two genes the mutation is between with a / between the two names, and the samples the mutation was found in.

The third table of insertion mutations has five columns: the chromosome position of the start of the insertion in the reference sequence, the newly inserted sequence, the local sequence for five base pairs in each direction around the insertion with the insertion in curly braces, the name of the gene the insertion is in if it is inside a gene or the name of the two genes the mutation is between witha / between the two names, and the samples the mutation was found in.

The fourth table of mobile element mutations has seven columns: the position of the mutation, the name of the mobile element, the strand of the mobile element insertion, the size of any duplications of sequence of the target site next to the mobile element insertion, the repeat size of the mobile element, the gene, and the samples the mutation was found in.
