

Figure S6: Allele balance at heterozygous site plots for all knock-out *C. albicans* isolates sequenced in this study.

Plots showing the allele balance at heterozygous sites across the 8 chromosomes. Sequencing confirms the presence of homozygosity, a long tract LOH, on the left arm of Chr4 (either haplotype A or B according to the strain) in mono-fluorescent isolates. The orange vertical line on Chr4 represents the I-SceI-break site.
