Figure S8. Map of *Sesamia nonagrioides* alpha-amylase gene copies. The exon/intron structure of *S. nonagrioides* alpha-amylases (*SnAmy1-3* on top), as inferred from our tblastn search, is compared to that of *Helicoverpa armigera* alpha-amylase 2 (*HaAmy2*, bottom). The *SnAmy1* and *SnAmy2* genes are both located on scf7180000017447_1 (from position 112,199 to 118,080 and from position 56,757 to 48,005, respectively) and *SnAmy3* on scf7180000016148_1 from position 307,554 to 300,359. Coding exons are in green and non-coding exons are in red. Introns and exons are drawn to scale. Incomplete versions of the three *SnAmy* copies were retrieved by our automatic annotation (SNONA2_00013269, SNONA2_00013268 and SNONA2_00007091).
