

## SUPPLEMENTAL FIGURES AND TABLES

**Figure S1.** **a)** Bootstrap distribution ( $n = 1000$ ) of the number of overlapping genes between our candidate genes and a random set of candidate genes (black kernel density estimate) vs. the observed number of overlapping genes (red line) between our candidate genes and 552 candidate genes previously associated with fecundity (Durham *et al.* 2014). For each bootstrap sample, a random set of 552 candidate genes was chosen without replacement from a list of genes associated with DGRP variants (annotation based on FlyBase release 5.57). **b)** QQ plot comparing observed and expected  $p$ -values, with the red line showing a 1:1 relationship. **c)** Linkage disequilibrium heat map for all the variants identified ( $p < 1\text{E-}4$ ).

**Table S1. Heritability estimates for the means of the four phenotypes.** HPD = highest posterior density.

Phenotype	Heritability Estimate	95% HPD Interval
Mean ♀ Weight	0.64	0.55 - 0.72
Mean ♂ Weight	0.73	0.65 - 0.80
Number of ♀	0.47	0.37 - 0.57
Number of ♂	0.48	0.39 - 0.58

**Table S2. Variants significantly associated with offspring number and mass ( $p < 1E-5$ ).**

Chromosome coordinates represented in dm5 assembly coordinates. MAF = minor allele frequency, Del = deletion, Ins = insertion, and numbers in parentheses represent the number of basepairs to the closest gene.
