

Supplemental Material

Supplemental Figures

Figure S1. Changes in Root angle in M82 and Penn do not represent skewing. Percentage of roots (y-axis) showing skew to the left or to the right in M82 ($n=68$) and PENN ($n=78$). No preference to skew to the left or the right is observed using a chi-square test and thus the null hypothesis is accepted.

Figure S2. Mean root growth rate per time point in the two hours following rotation of M82 ($n=89$) and PENN ($n=18$).

Figure S3. Overlap between average absolute angle QTL and root tip angle QTL. Venn diagram showing overlap between QTL identified for average absolute angle in this study compared to Ron et al. 2013.

Figure S4. Pearson correlation of AvgAbsAng with swing rate at each of the 34 time points.

Figure S5. Precomputed phylogenetic tree of AT5G50400 (PAP27) and homologs in different species. Homology to the protein sequence of AT5G50400 (Vilella et al. 2009; EBI 2015) is used. The taxon designation of the three highest nodes is shown. Subnodes that do not contain any genes from *A. thaliana* or *S. lycopersicum* are collapsed. PAP27 and its paralogs in *A. thaliana* and homologs in *S. lycopersicum* are called out in larger type. Alignments are shown to the right.

Figure S6. Maximum likelihood phylogenetic tree of AT5G50400 (PAP27) and homologs in *A. thaliana*, *S. lycopersicum*, and *S. pennellii*. Tree is computed with 200 bootstraps using MEGA (Tamura et al. 2011) from protein sequences. Suffixes "-out1" and "-out2" mark genes used as outgroups. Homologs were identified using the gene tree from **Fig S3** and with BLAST+ (Camacho et al. 2009). Multiple alignment used Muscle (Edgar 2004).

Figure S7. Root Length of AtPAP27 overexpression lines does not linearly correlate with expression of AtPAP27. Error bars represent standard error of the mean, $n_{\text{avgAbsAng}}(\text{Col-0})=275$, $n_{\text{avgAbsAng}}(35S:\text{AtPAP27}/\text{lineA})=11$, $n_{\text{avgAbsAng}}(35S:\text{AtPAP27}/\text{lineB})=20$, $n_{\text{avgAbsAng}}(35S:\text{AtPAP27}/\text{lineD})=83$, $n_{\text{avgAbsAng}}(35S:\text{AtPAP27}/\text{lineF})=100$; $n_{\text{EXPRESSION}}(\text{Col-0})=$, $n_{\text{EXPRESSION}}(35S:\text{AtPAP27}/\text{lineA})=11$, $n_{\text{EXPRESSION}}(35S:\text{AtPAP27}/\text{lineB})=20$, $n_{\text{EXPRESSION}}(35S:\text{AtPAP27}/\text{lineD})=22$, $n_{\text{EXPRESSION}}(35S:\text{AtPAP27}/\text{lineF})=7$.

Figure S8. AvgAbsAng measurements capture the variation in the top and bottom 5 accessions for "Direction Index" (A) and "Root Angle". In each panel, the accessions with the highest "Direction Index" or "Root Angle" are shown on the left, while the accessions with the lowest "Direction Index" or "Root Angle" are shown on the right. n(Wa-1)=23, n(Cvi-0)=24, n(Kl-5)=24, n(Jm-0)=24, n(Eds-1)=18, n(Cala-8)=22, n(Yo-0)=21, n(Hh-0)=22, n(Rak-2)=20, n(Col-0)=22, n(Coc-1)=23.

Figure S9. SNP patterns of contrasting accessions for direction index. (A) Gene models in the *CDC73* region. (B) GWAS LOD score for the “median direction index day4” trait. (C) Exemplary accessions for low and high values of the direction index trait that was mapped using GWAS. A potentially relevant SNP that was not included in the original 250K SNP chip is indicated by the red box. Following criteria for the selection of the depicted accessions were used: 1) Genome sequence for accession is available on the <http://signal.salk.edu/atg1001/3.0/gebrowser.php> 2) For accessions with the lowest direction indexes: those having reference allele A/T (associated with low direction index) at the GWAS identified marker position (Chromosome 3, position 8008000) were selected. For accessions with highest direction indexes: those having marker SNP C/G (associated with high direction index). 3) For accessions with low direction index: examples from three haplotypes (inferred by fastPHASE) are shown with two exemplary accessions for each haplotype. Extreme accessions with the highest direction index belong (except Cvi-0) to the same predicted haplotype.

Figure S10. Root length of *cdc73* mutant alleles does not vary in a manner similar to root angle. Error bars represent standard error of the mean, n(Col-0)=144, n(*cdc73*-1)=85, n(*cdc73*-2)=26, n(FRI)=22, n(FRI/*cdc73*-1)=32.

Supplemental Datasets

1. **S1_Dataset.zip:** zip file of code, input data, and output files for average absolute angle phenotype analysis.
2. **S2_Dataset.zip:** zip file of code, input data, and output files for rotation phenotype analysis.
3. **S3_Dataset.zip:** Normalized average expression of all genes in the 76 introgression lines.

4. **S4_Dataset.xlsx:** Dataset of p-values from GWAS on root direction index on DAG 4 of 257 accessions; Uncorrected genome-wide association p-values for each SNP tested. Minor allele count (MAC) refers to the number of accessions in the study panel carrying minor allele for the respective SNP. Minor allele frequency (MAF) refers to the frequency thereof.

Table S1. Number of samples, mean, and standard error for root angle traits in *S. lycopersicum* cv. M82, *S. pennellii*, and all ILs significantly (q-value <= 0.05) different from M82, with p-values and their FDR-adjusted (Benjamini and Hochberg) q-values for the genotype contribution being significant. The comparison used the mixed-effect linear model "trait ~ genotype + collide + (1|germAge) + (1|plateDate)", where "trait" is the avgAbsAng, "genotype" is the plant genotype, "collide" is TRUE if the plant root collided with another plant's root during growth on the plate, "germAge" is the age since germination and is a random-effect variable, and "plateDate" is the date of plating and is also a random-effect.

genotype	peak swing rate	peak time (timepoint)

Table S3. Number of samples, mean, and standard error for swing rate at all 34 timepoints in *S. lycopersicum* cv. M82, *S. pennellii*, and all ILs significantly ($q\text{-value} \leq 0.05$) different from M82 for swing rate, with p-values and their FDR-adjusted (Benjamini and

Hochberg) q-values for the genotype contribution being significant. The comparison used the simple fixed-effect linear model "swing rate ~ genotype".

Table S9. Homologous pairs, symbol names, and root tissue expression levels for selected purple acid phosphatase genes. Each row is pair of homologous genes in the two species. Based on these genes' similarities to ATPAP27 (AT5G50400) and on phylogenetic trees of these genes (**Figure S4, S5**), we assigned the symbolic names shown here to these genes. Expression values are RNA-seq for root tip tissue, normalized counts and Z-scaled (mean 0, standard deviation 1).
