SUPPLEMENTAL MATERIALS

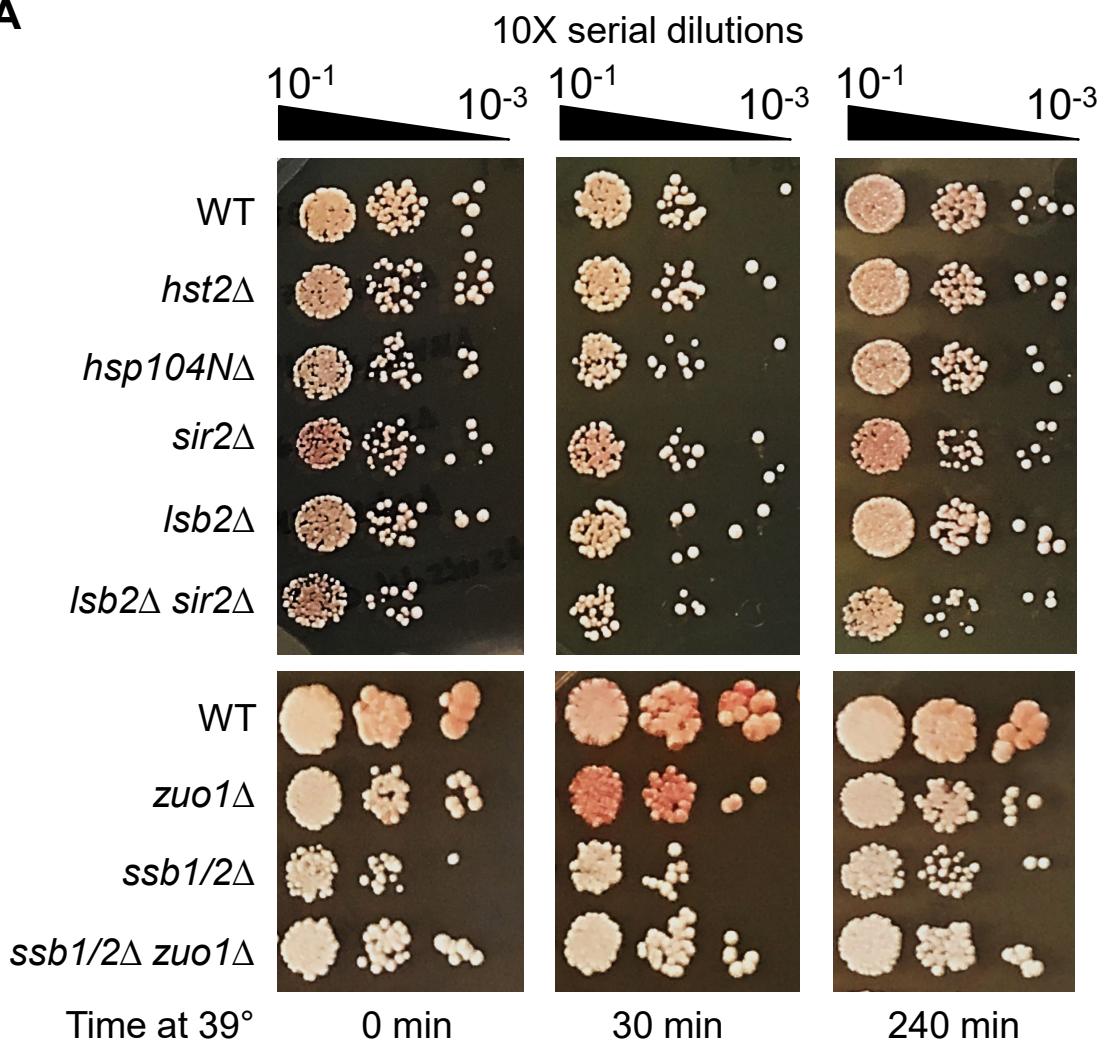

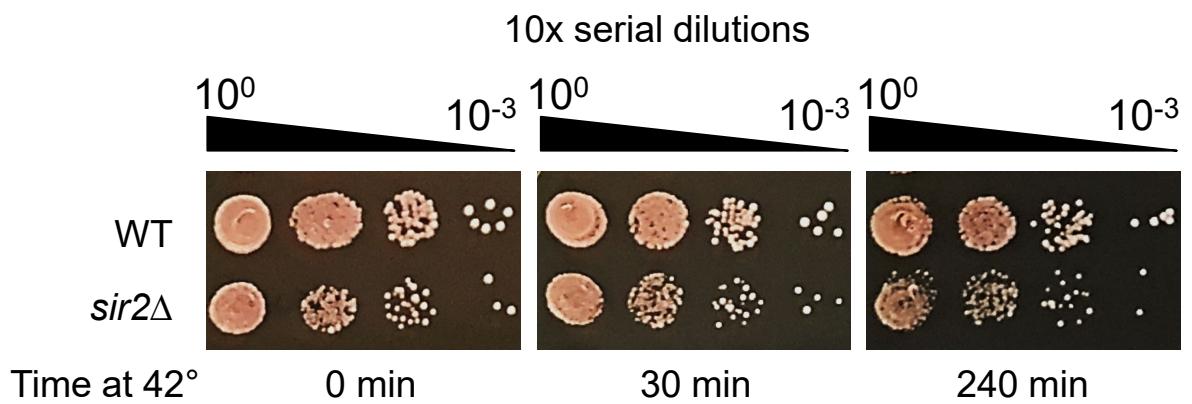

A**B**

Figure S1. Viability of wild-type and deletion after heat shock. Exponential cultures grown at 25° were sampled and heat shocked either at 39° (A) or 42° (B) as described in Materials and methods. Samples were taken at each time point, and serial decimal dilutions were spotted (5 µL per plate) onto YPD plates, from 1:10 dilution (A) or from undiluted culture (B). Images of plates are taken after for 4-6 (A) or 2 (B) days of incubation at 25°.

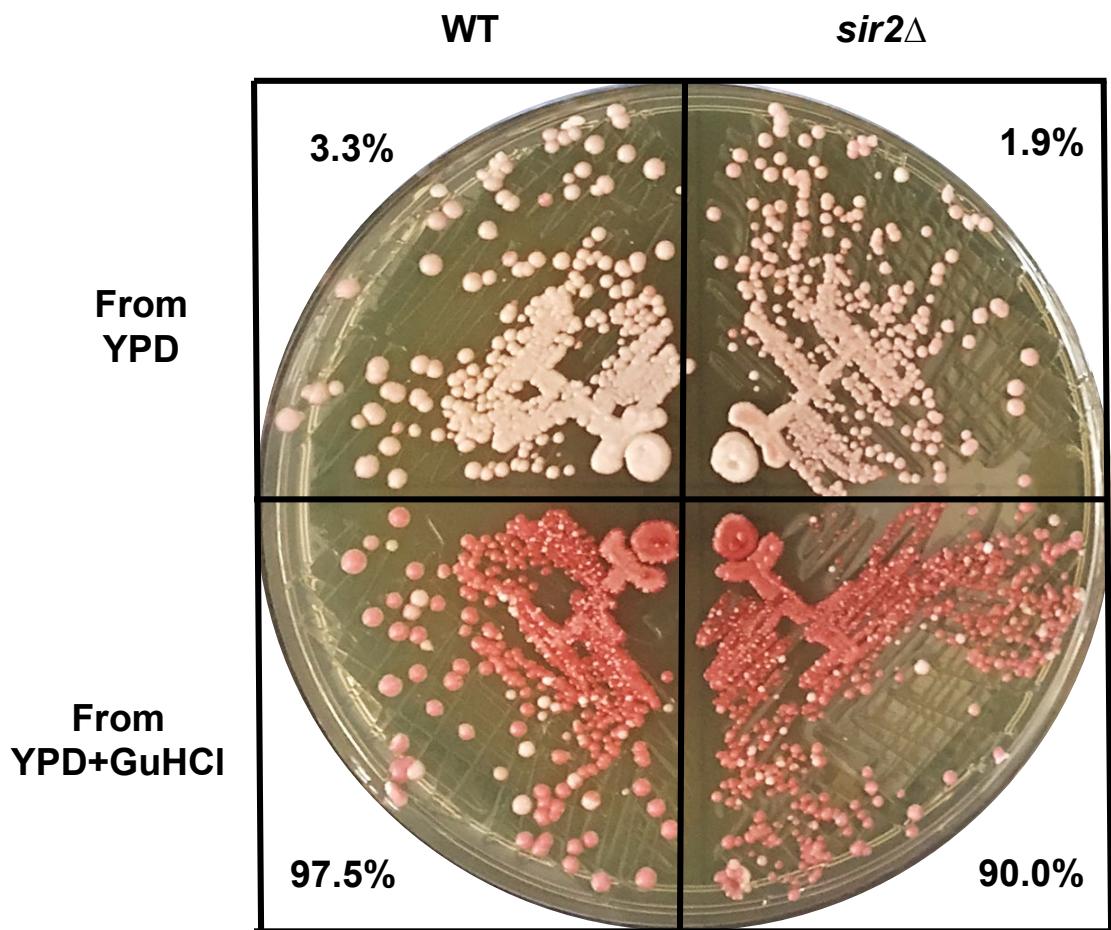

Figure S2. Curing of $[PSI^+]$ by growth in the presence of 5 mM guanidine hydrochloride (GuHCl) in wild-type (WT) and $sir2\Delta$ strains. Cultures were passaged three times on either YPD or YPD with 5 mM GuHCl plates, and then spots streaked out for single colonies on a fresh YPD plate. Percentage of red ($[psi]$) colonies for each culture/treatment is shown in the same quadrant.

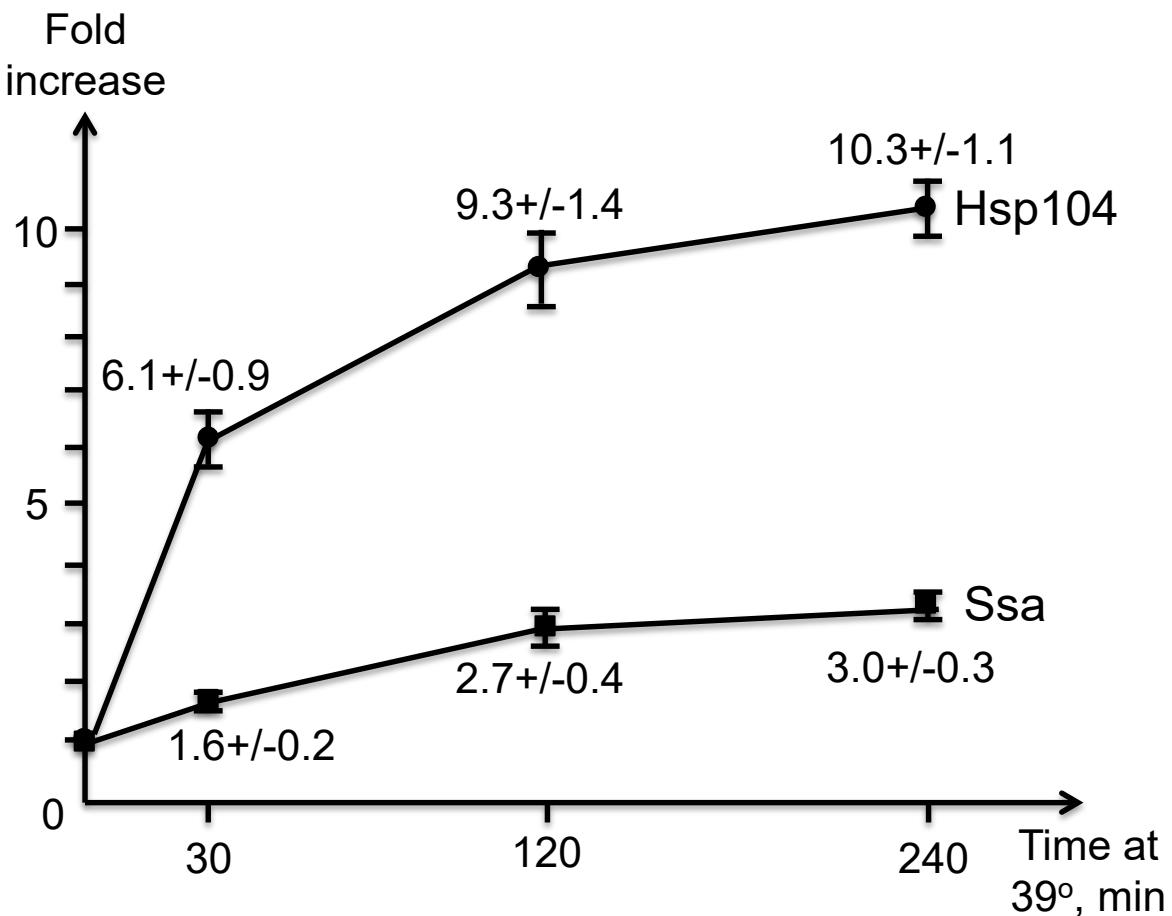

Figure S3. Hsp induction in the wild type strain during heat shock at 39°. Levels of the Hsp104 and Ssa proteins were determined by Western blotting, followed by reaction to respective antibodies, densitometry and normalization by loading control (Ade2 or Coomassie stained proteins). Fold increase relative to the level of respective protein in the exponential culture before heat shock is shown. Results are averaged from 8 to 12 repeats per each time point. Bars represent standard errors.

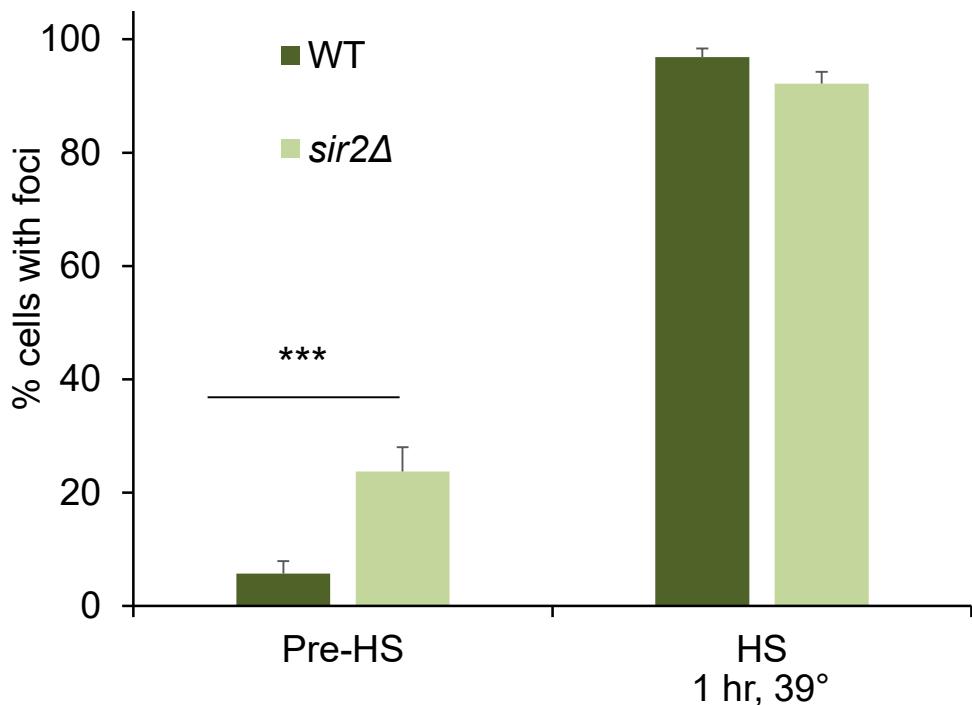

Figure S4. Accumulation of cells with aggregates in wild-type (WT) and *sir2Δ* strains at 39°. Cells were grown at 25°, sampled before heat shock (Pre-HS) and after 1 hr at 39° (HS), and analyzed by fluorescence microscopy.

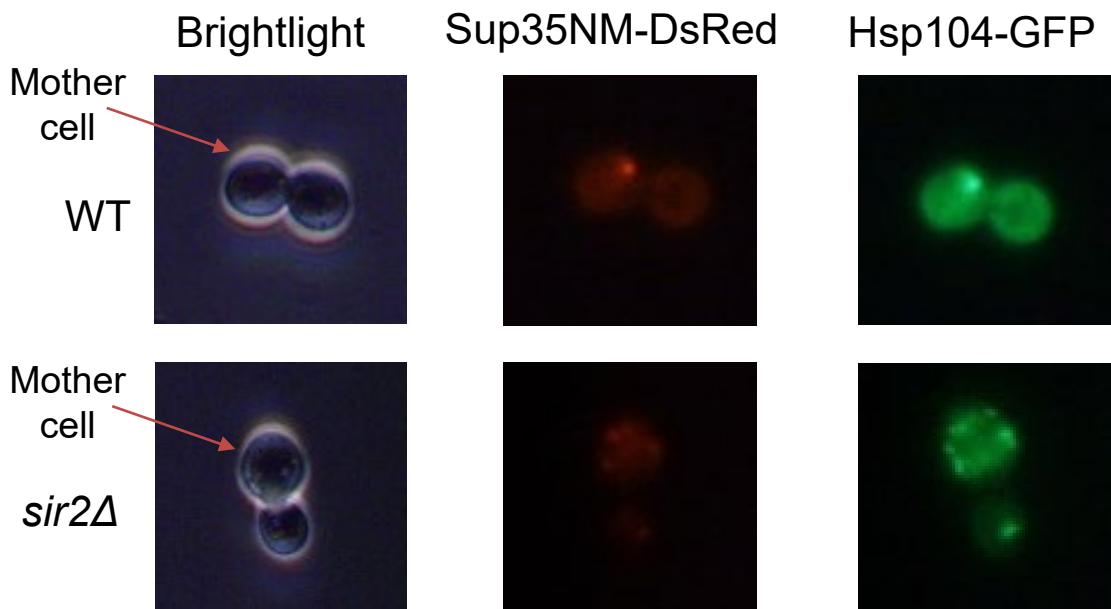

Figure S5. Differences in mother-specific aggregate retention between wild-type and *sir2Δ* cells. Cultures were heat shocked for 1hr at 42° and recovered for 4 hrs at 25°. Examples of cell pairs containing aggregates in mother cell (WT strain) or in both mother and daughter cells (*sir2Δ* strain) are shown.

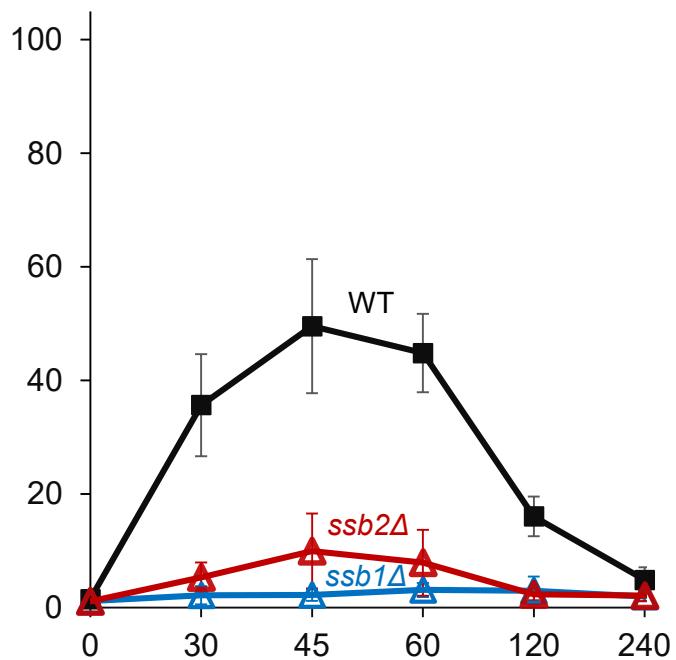

Figure S6. Comparison of $[PSI^+]$ destabilization by 39°C heat shock in the wild-type (WT) strain and single $ssb1\Delta$ or $ssb2\Delta$ deletion strains. Heat shock was performed at 39° as described previously. Differences are significant in all cases where bars corresponding to standard deviations do not overlap. WT data are the same as on Fig. 5B, as experiments were run in parallel. See Table S13 for colony numbers and Table S14 for p values.

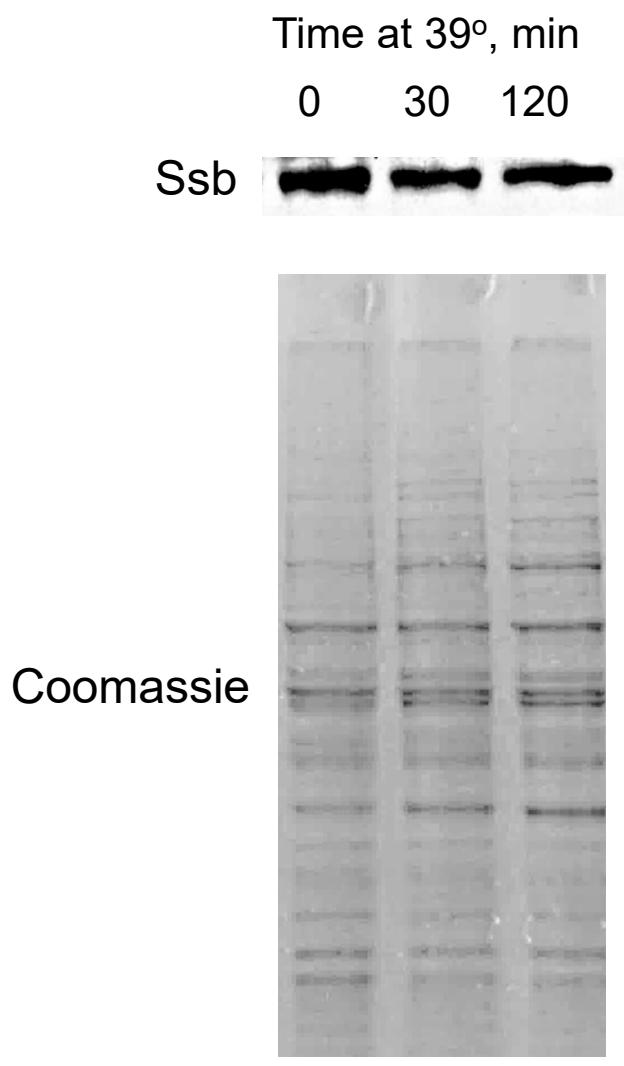

Figure S7. Ssb protein levels are not increased during mild heat shock. An example of *zuo1Δ* strain is shown. Coomassie stained gel is included as a loading control. Similar results were observed for the wild-type strain.

Table S1. Viability of yeast strains during incubation at 39°.

Strain	Cfu*/ml at start (\pm SD**)	Fold change after incubation at 39° \pm SD	
		30 min	240 min
WT	(1.15 \pm 0.015) $\times 10^7$	1.35 \pm 0.53	1.37 \pm 0.60
<i>hsp104-ΔN</i>	(1.04 \pm 0.45) $\times 10^7$	1.24 \pm 0.63	1.30 \pm 0.39
<i>sir2Δ</i>	(1.45 \pm 0.545) $\times 10^7$	1.13 \pm 0.32	1.22 \pm 0.24
<i>ssb1/2Δ</i>	(1.24 \pm 0.29) $\times 10^7$	0.96 \pm 0.25	1.06 \pm 0.16

*cfu - colony-forming units

**SD - standard deviation

Table S2. Effects of 39°C heat shock on wild-type and *hsp104-ΔN* strains (numbers of colonies for Fig. 1A).

Table S6. $[PSI^+]$ loss following induction of $P_{GAL}\text{-}HSP104$ in wild-type and $sir2\Delta$ strains (numbers for Fig. 1E).

Strain	Number of cultures analyzed	Incubation in galactose (hrs)	Number of colonies			
			Ade ⁻ ($[psi^-]$)	% \pm SD	Ade ⁺ ($[PSI^+]$)	Total
WT	3	0	14	4.0 \pm 3.0	350	364
		12	349	84.9 \pm 8.6	60	409
		24	474	95.8 \pm 4.6	21	495
$sir2\Delta$	3	0	2	0.5 \pm 0.5	464	466
		12	103	26.7 \pm 9.9	289	392
		24	363	68.5 \pm 8.7	171	534

Table S7. Comparison of normalized Hsp levels in wild-type and deletion strains.

Strain	Protein	Mean ratio of the protein levels in the deletion versus wild-type strain after incubation at 39° (with standardized error)			
		0 min	30 min	120 min	240 min
$sir2\Delta$	Hsp104	0.97 \pm 0.32	0.98 \pm 0.11	1.19 \pm 0.13	1.50 \pm 0.61
	Ssa	1.13 \pm 0.26	1.01 \pm 0.15	0.96 \pm 0.13	0.93 \pm 0.14
$ssb1/2\Delta$	Hsp104	0.95 \pm 0.05	1.04 \pm 0.10	1.06 \pm 0.21	0.84 \pm 0.09
	Ssa	1.10 \pm 0.24	1.38 \pm 0.12	1.19 \pm 0.19	0.95 \pm 0.13
$zuo1\Delta$	Hsp104	1.28 \pm 0.41	1.19 \pm 0.24	1.20 \pm 0.31	0.94 \pm 0.14
	Ssa	0.87 \pm 0.15	0.96 \pm 0.24	0.89 \pm 0.15	0.92 \pm 0.13

Proteins were detected by specific antibodies. Band intensities were measured by densitometry and normalized by loading control (Ade2 or Coomassie). Ratios between the normalized protein levels in the deletion and control wild-type strains were always determined for the pairs run on one and the same gel. Mean ratios and errors were calculated for each time point, based on the results for 3 to 7 independent cultures per each time point.

Table S8. Effects of 39° heat shock on wild-type strain in the absence and presence of nicotinamide (NAM) (numbers of colonies for Fig. 3A).

Strain	Number of cultures analyzed	Incubation at 39°, min	Number of colonies				
			Red ($[psi]$)	Mosaic ($[PSI^+]/[psi]$)	% red and mosaic \pm SD	White/pink ($[PSI^+]$)	Total
