Figure S2

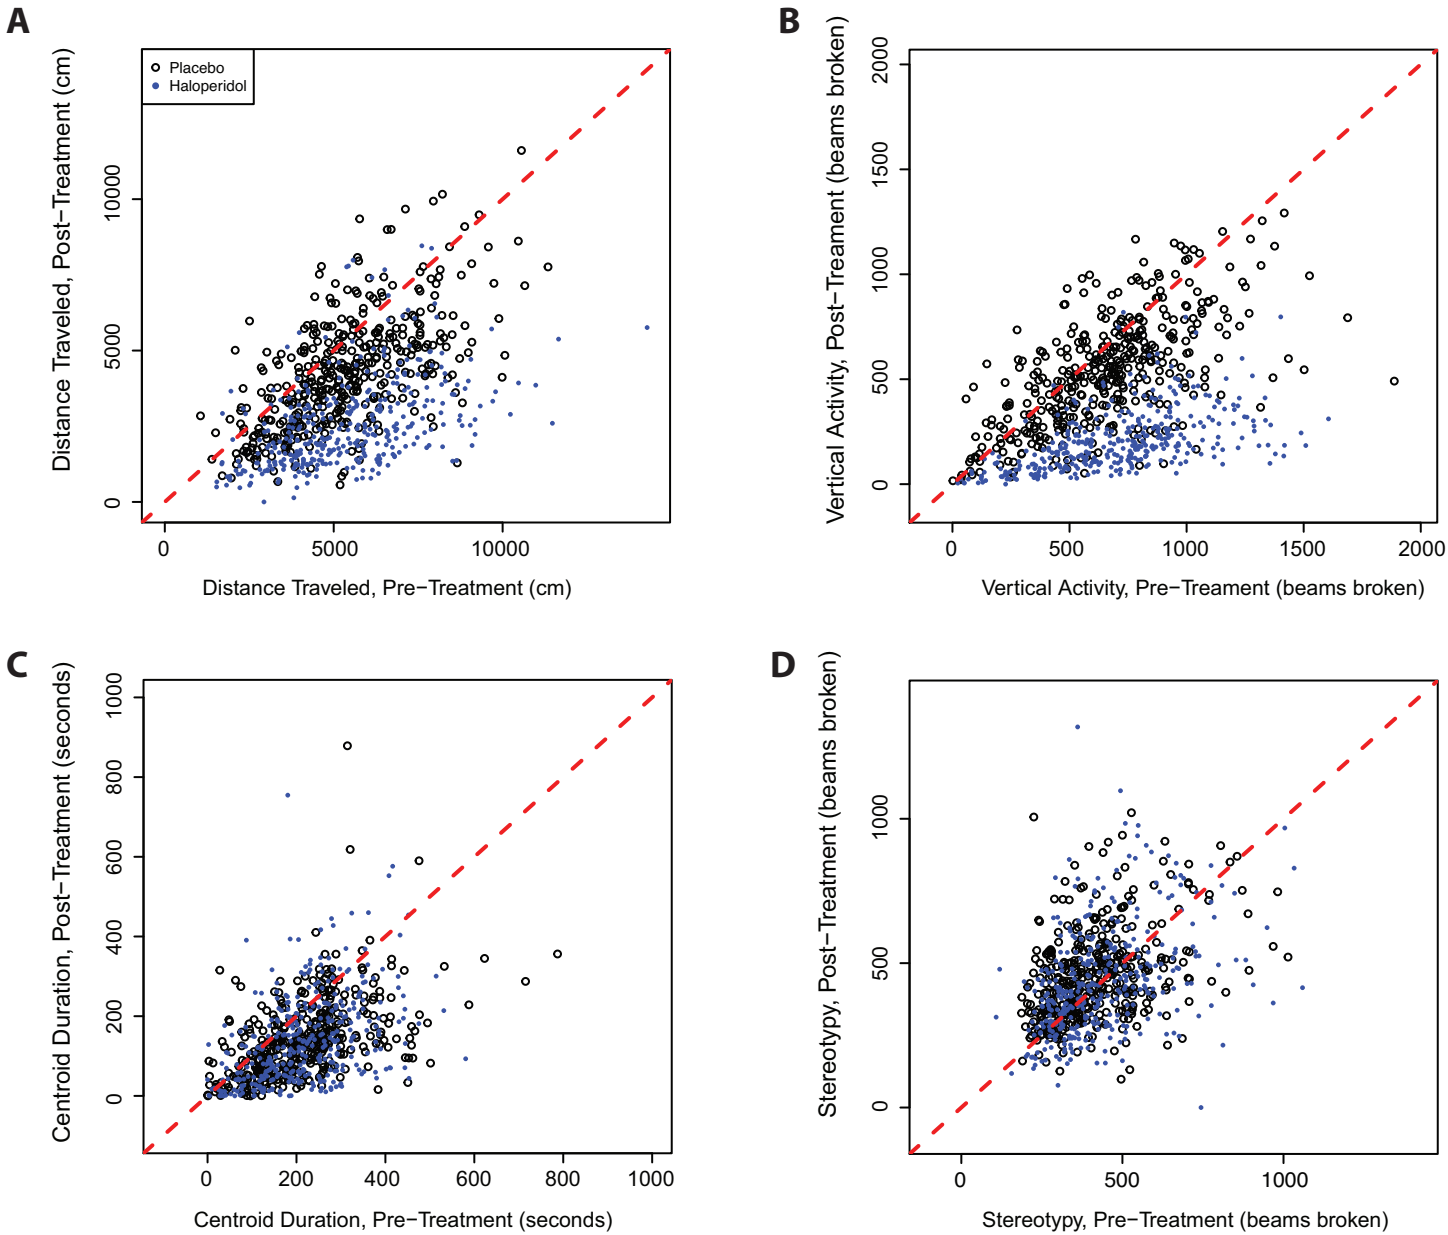

Figure S2. Haloperidol -induced changes in behavioral measures. (a) RIX mice show an overall reduction in distance traveled and (b) vertical activity after chronic drug treatment, with little impact on (c) centroid time and (d) stereotypy. (e) EPS measured using the inclined screen test. Each mouse is represented by either a blue (haloperidol) or a black (placebo) dot. Red line represents regression line for best fit.
