

Figure S2: Representative images of embryos used in this study. The unboxed embryos harbor each of the reporter constructs and were stained for *lacZ* and a normalization gene, *hkb*. The boxed embryos represent embryos stained for *eve* expression in the *eve*[*eveS2Δgt-2*] or control genotype. Note that *eve* expression was normalized to the levels of stripe 1, so the *hkb* costain data was not used. The images are maximum intensity projections of embryos aged at 9% membrane invagination.
